

# Waterborne pathogens: Innovating evidence based practice for safe sanitation in Uganda

*Funded by the Bill and Melinda Gates Foundation*

**Innocent K. Tumwebaze (PhD)**  
Postdoc Fellow, Temple University,  
Water Pathogens-K2P Country Director

<https://www.youtube.com/watch?reload=9&v=TcpuE8vBOyQ>

# What Knowledge to Practice (K2P) is about?

- Improving accessibility to data through **new ICT tools** to support **evidence-based** practice for safe sanitation
- Using **scientific data on pathogens** to **advocate** for best practices
- Empowering Water and Sanitation Service Providers
  - Decision support tools
  - Knowledge sharing
  - Capacity building (training & awareness raising)

# K2P- Using data generated from the Global Water Pathogen Project (GWPP)

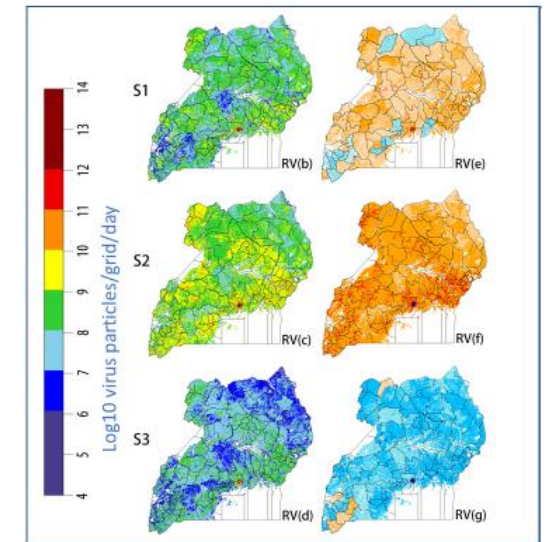

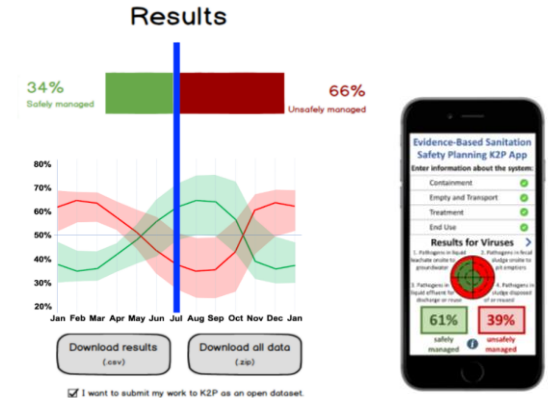

**GWPP**  
Global Water Pathogen Project

[www.waterpathogens.org](http://www.waterpathogens.org)

254 contributors from 49 countries

## Pathogen Flow Tools

## Pathogen Emissions Mapping Tool

# Target Stakeholder Groups and Uses of Tools

Scale	Possible Uses	User Groups
Global	Guidelines and policies, educational programs	UNESCO, WHO, UNICEF, UNDP
National/ Regional	Large scale implementation, resource prioritization, working across communities, watersheds, sectors	Govt, Ministries, Water Authorities
Local	Building/ choosing sanitation systems, integration with education	Institutions, utilities, NGOs, community coalitions

# What pathogens are found in sewage and excreta?

**Viruses**  
**rotavirus**

- Extremely small
- Infectious
- Often move like chemicals

**Bacteria**  
***Cholera, Typhoid***

- Microscopic (smaller than algae)
- *E.coli*/coliforms are bacteria

**Protozoa**  
***Entamoeba Histolytica***

- Size of algae
- Produce egg like cysts
- Resistant to chlorine

**Helminths eggs**  
**Hookworm**

- Large
- Produce eggs
- Often need to mature in the environment
- Long survival

# Why pathogen type is important?

- **Size ( viruses < bacteria < protozoa < helminths)**
  - Important for removal or disinfection through treatment systems
  - Important for transport into groundwater
- **Persistence/ survival in the environment and treatment systems varies by organism type**

# Differences between pathogens and indicator organisms

## Indicators

**Total coliforms, fecal coliforms and *E.coli* belong to the bacteria group and don't behave like viruses, protozoa or helminths**

- Easier to detect/ measure
- Less costly to monitor
- Indirectly can suggest a health risk

# GWPP-K2P App: Sanitation Decision Support Tool

Choose one of the following options:

Pathogen Flow  
Model

Pathogen Mapping  
Model

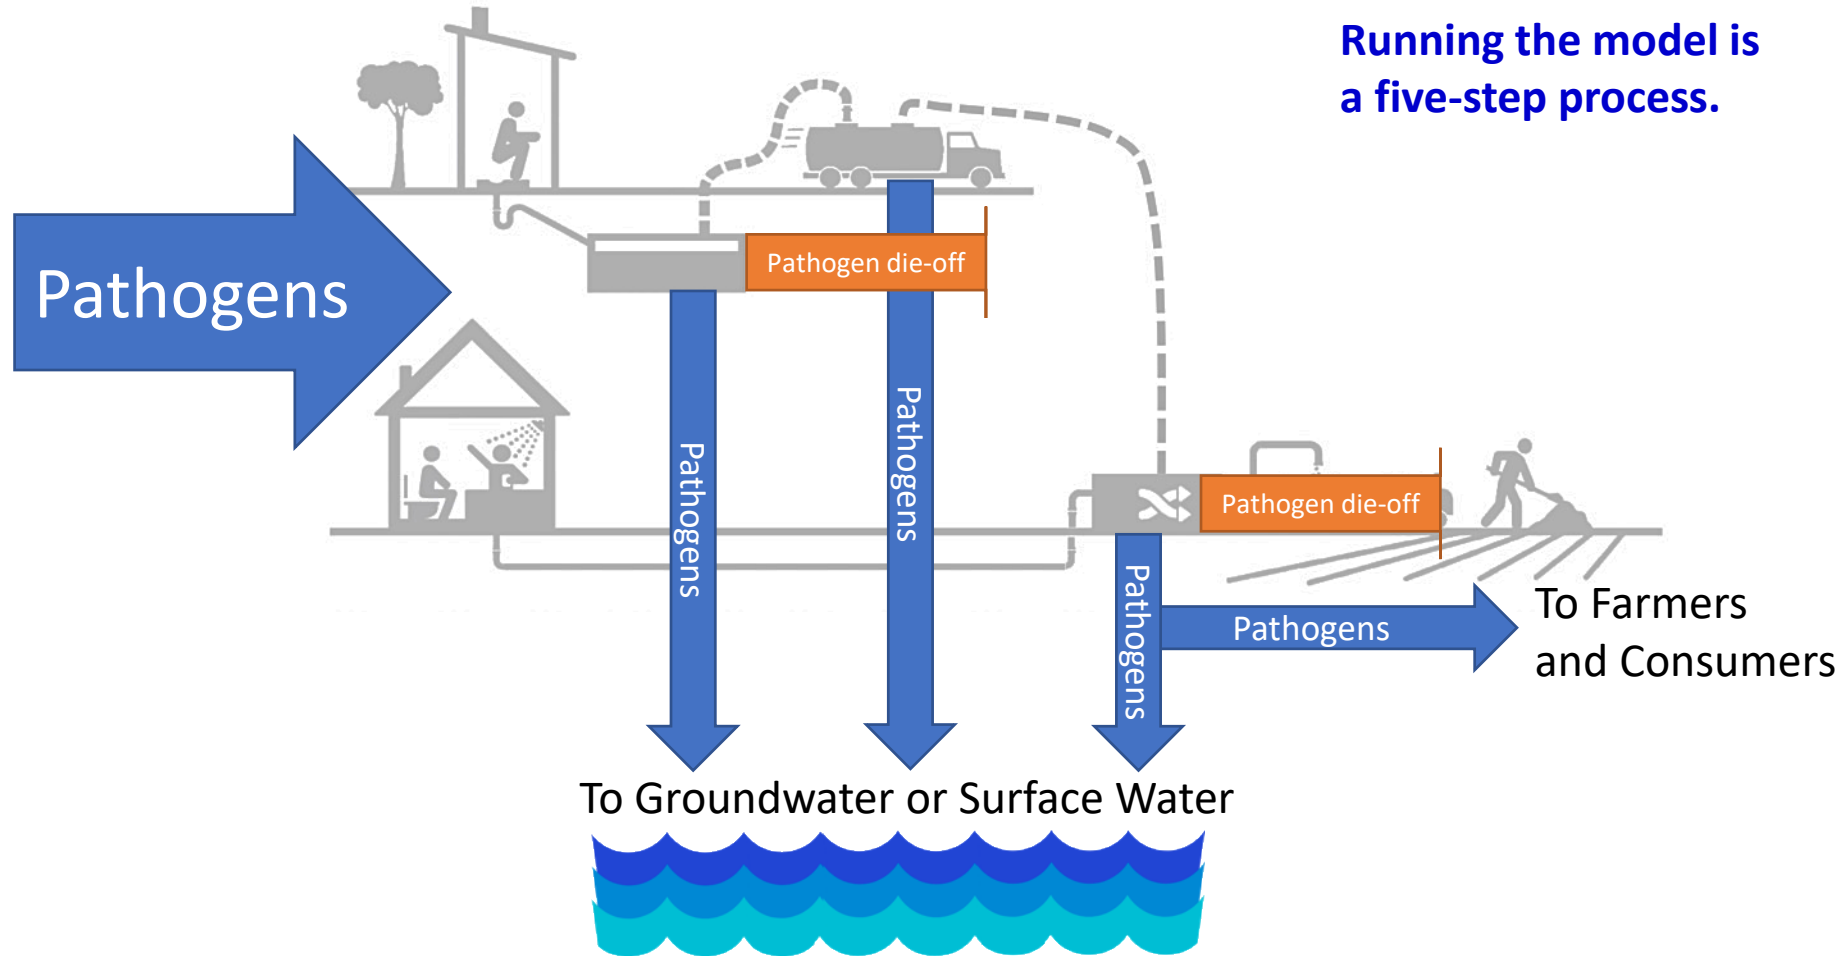

GWPP-K2P  
Database

Case Studies

# Pathogen Flow Model

Predicts **pathogen reduction** for a given treatment technology based on design, environmental, and operational factors

Step 1. Define the boundary

Step 2. Set the health target

Step 3. Upload and input data

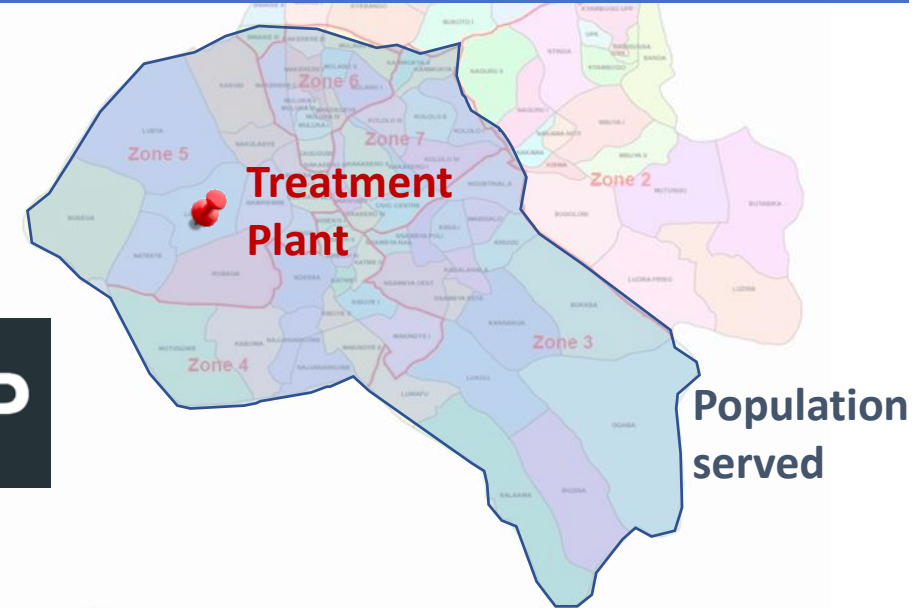

Step 4. Run the model

Step 5. Save or share results

Maximum tolerable  
probability of infection?

1 in 1,000 per year

4-log reduction

*JMP  
Data*

*GWPP  
Data*

*Additional  
Data Needs*

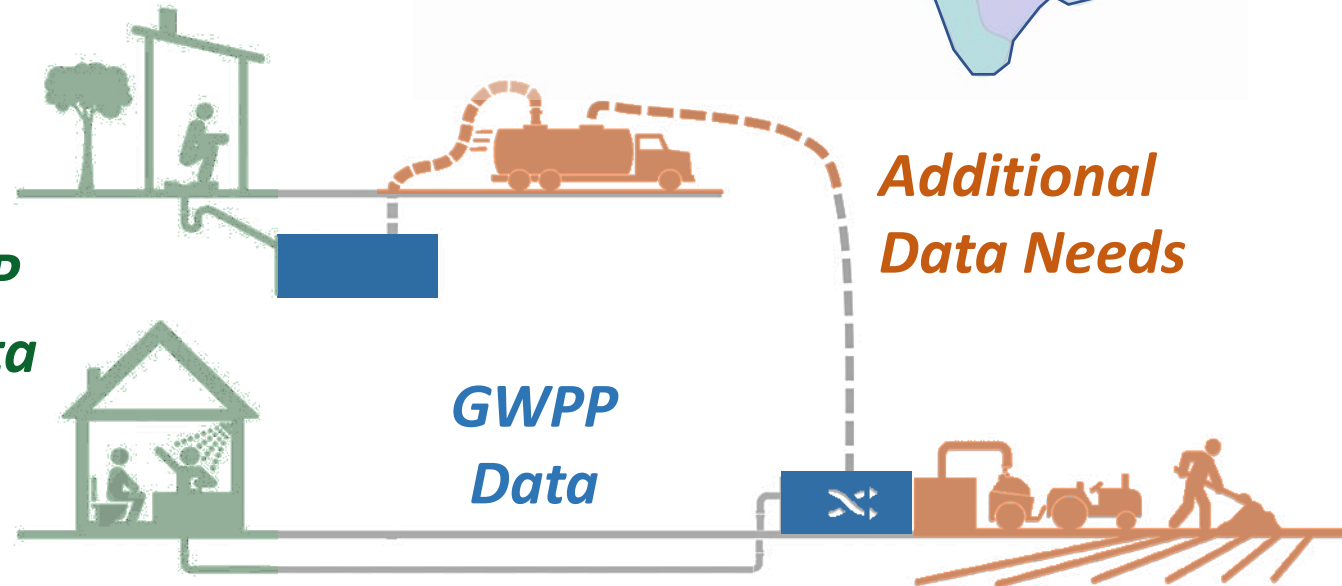

**65%**

Probability Target Log  
Reduction Achieved

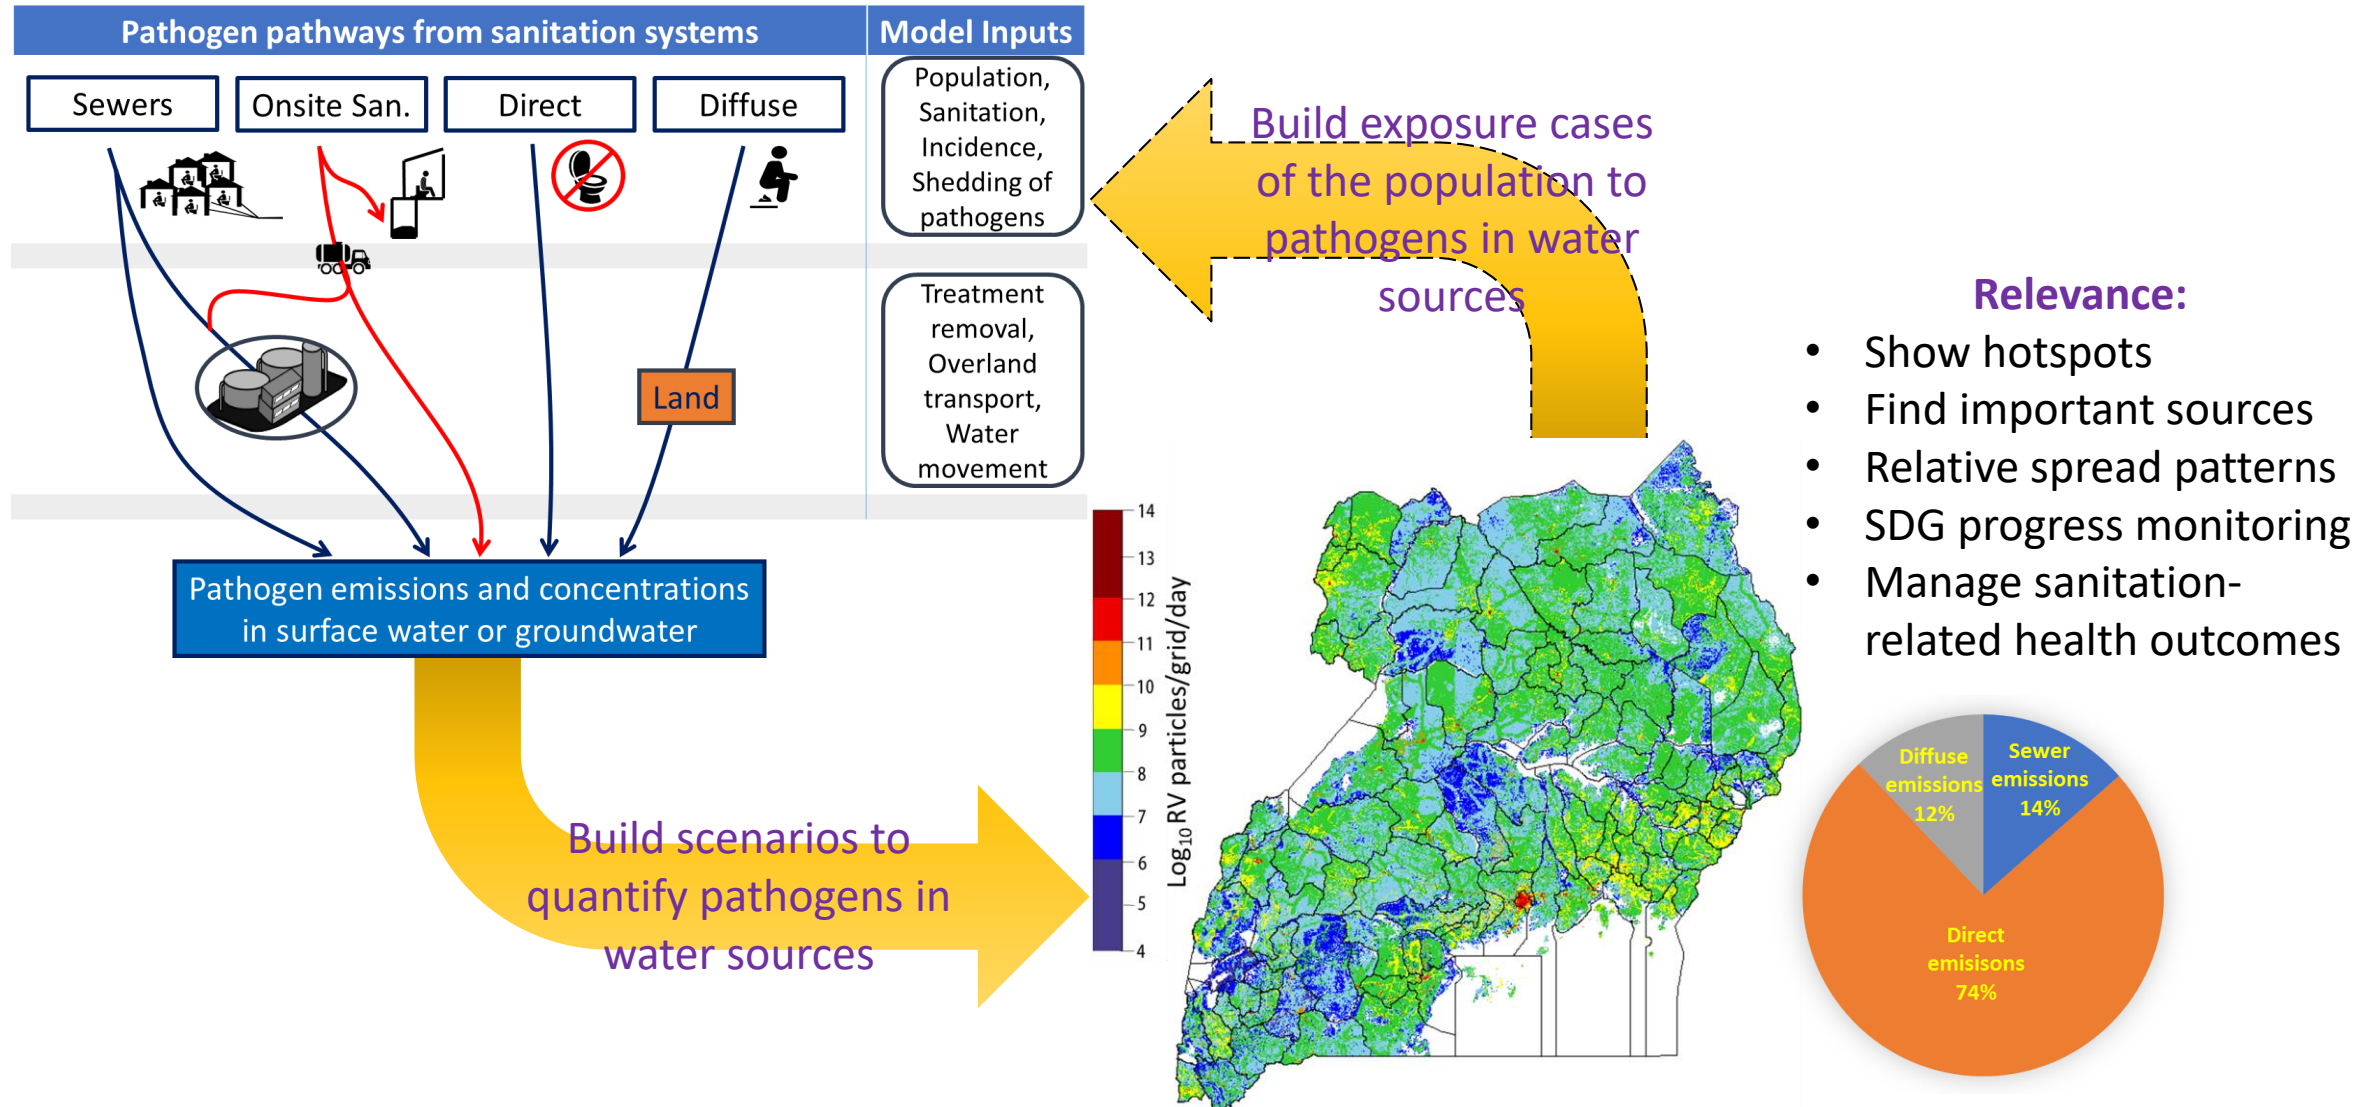

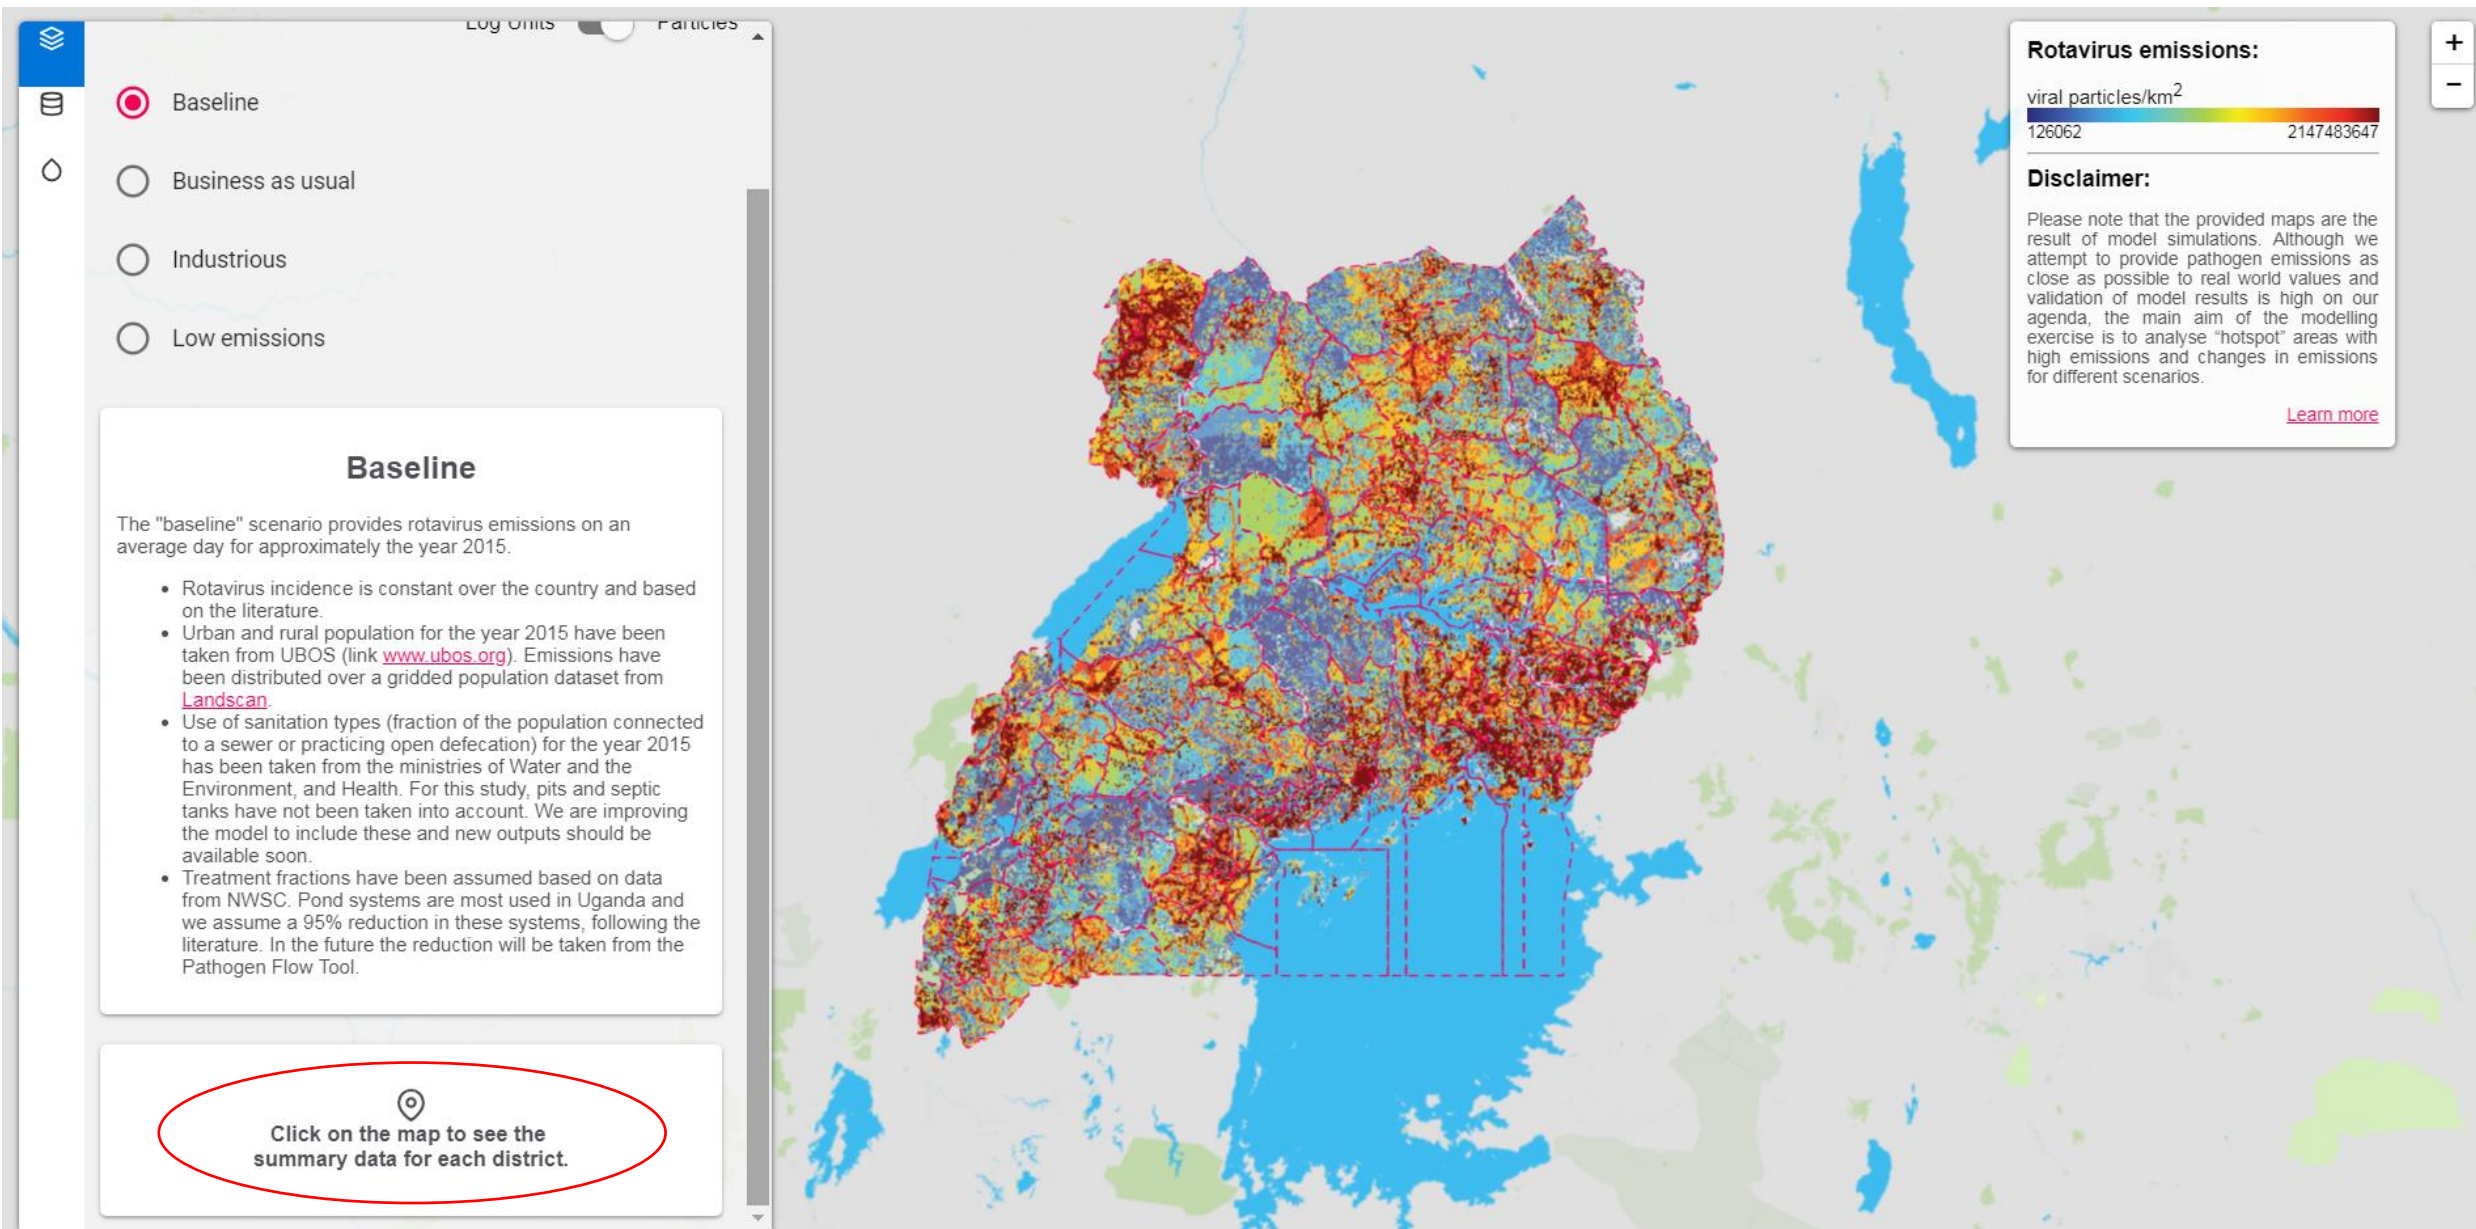

**35%**

Probability Target Log  
Reduction Not Achieved

# Modelling and mapping approach

# AMR in excreta and wastewater

- Interested in studying AMR along the sanitation service value chain (containment, emptying, transportation, treatment, dispose of /reuse)
- From this AMR Symposium we are interested in obtaining surveillance data for Kampala for the annual number of cases of:
  - ✓ Drug-resistant Non-typhoidal *Salmonella*,
  - ✓ Drug-resistant *Salmonella Typhi*,
  - ✓ Drug-resistant *Campylobacter*,
  - ✓ Drug-resistant *Shigella*,
  - ✓ Extended Spectrum Beta-Lactamases (ESBL) *E.coli*,
  - ✓ Drug-resistant enterotoxigenic *E. coli*

- We are interested in collaborating with hospitals/clinics in Kampala that
  - Regularly **screen for AMR pathogens**, and **collect rectal swabs or stool** samples
  - Clinics/ hospitals that would be interested in this type of work
- We are interested in the priorities of the MoH, in terms of AMR pathogens of national importance that would be meaningfully and be of relevance to the country

# Thanks for listening
